                                                          It is prohibited here because:
8027
                                   <1>
                                                          1) Signal Response Byte method has not advantage
8028
                                   <1>
                                                             against INT 32h, function AH = 1. Also,
8029
                                   <1>
                                                             keyboard service interrupt will return with
8030
                                   <1>
                                                             ascii and scan codes (AL, AH) while
                                                             SRB method has only 1 byte space for ascii code
8031
                                   <1>
8032
                                  <1>
                                                             or scan code. One byte signal response is used
8033
                                   <1>
                                                             for ensuring very simple and very fast
8034
                                   <1>
                                                             virtual to physical memory address conversion
8035
                                   <1>
                                                             without any memory page crossover risk.
8036
                                   <1>
                                                             (Otherwise double page conversion or word
8037
                                  <1>
                                                             alignment would be needed.)
8038
                                   <1>
                                                          2) Badly written user code (callback code)
8039
                                   <1>
                                                             can prevent keyboard and timesharing functions
                                                             of the operating system via continuous and long
8040
                                   <1>
                                                             keyboard event handling by callback service.
8041
                                   <1>
8042
                                                              (It can cause to lose immediate keystroke
                                   <1>
                                                             response from hardware to user.)
8043
                                   <1>
8044
                                  <1>
                                                          3) If user will check any keyboard events, 'getkey'
8045
                                   <1>
                                                              (or 'getchar') must have more priority than other
8046
                                                              (video etc.) events because only control ability
                                   <1>
8047
                                  <1>
                                                             on a procedural infinite loop is a keyboard or
8048
                                   <1>
                                                             mouse event. So user can use keyboard function
8049
                                   <1>
                                                             at the end or at the beginning of a loop.
8050
                                   <1>
                                                             In this case, INT 32h is used for that purpose
8051
                                   <1>
                                                             and timer interrupt etc. callbacks can be used
8052
                                  <1>
                                                             for dynamic and synchronized data refresh/transfer
8053
                                   <1>
                                                             while cpu is in a static loop (without polling).
8054
                                                             Keyboard Int callback is not more useful because
                                   <1>
8055
                                   <1>
                                                             already a manual check (a key is pressed or not)
8056
                                                             can be performed (via INT 32h, AH = 1) efficiently
                                   <1>
8057
                                  <1>
                                                             in a loop to prevent a locked infinitive loop.
8058
                                   <1>
8059
                                   <1>
                                                       Disk IRQs (6,14,15) have been phohibited from ring 3
8060
                                   <1>
                                                       callback because, disk operations (file system services
                                                       etc.) are independent from user program, for fast disk r/w.
8061
                                   <1>
8062
                                  <1>
                                                       They are not more useful at ring 3 while they are in use
8063
                                   <1>
                                                       by standard diskio functions which are mandatory part of
8064
                                   <1>
                                                        (monolithic) OS kernel and mainprog command interpreter.
8065
                                   <1>
                                                       INT 33h diskio functions are enough for user level disk
8066
                                   <1>
                                                       r/w.
8067
                                  <1>
                                             ; TRDOS 386 - IRQ CALLBACK structures (parameters):
8068
                                   <1>
8069
                                   <1>
8070
                                   <1>
                                                       [u.irqlock] = 1 word, IRQ flags (0-15) that indicates
                                                                 which IRQs are locked by (that) user.
8071
                                   <1>
                                                                  Lock and unlock (by user) will change
8072
                                  <1>
8073
                                   <1>
                                                                 these flags or 'terminate process' (sysexit)
8074
                                   <1>
                                                                 will clear these flags and unlock those IRQs.
8075
                                   <1>
8076
                                   <1>
                                                                 Bit 0 is for IRQ 0 and Bit 15 is for IRQ 15
8077
                                  <1>
8078
                                   <1>
                                                      IRQ(x).owner
                                                                        : 1 byte, user, [u.uno], 0 = free (unlocked)
8079
                                   <1>
8080
                                   <1>
                                                      IRQ(x).method : 1 byte for callback method & status
8081
                                   <1>
                                                                    0 = Signal Response Byte method
8082
                                  <1>
                                                                    1 = Callback service method
8083
                                   <1>
                                                                    >1 = invalid for current 'syscalback'.
                                                                 or(+) 80h = IRQ is in use by system (ring 0)
8084
                                   <1>
8085
                                   <1>
