  78                              <1> ;;
  79                              <1> ;;  what for: User pages may be swapped out, when accessing
  80                              <1> ;;  a page in kernel/system mode, if it would be swapped out,
  81                              <1> ;;  kernel would have to swap it in! But it is also may be
  82                              <1> ;;  in use by a user process. (In system/kernel mode
  83                              <1> ;;  kernel can access all memory pages even if they are
  84                              <1> ;;  reserved/allocated for user processes. Swap out/in would
  85                              <1> ;;  cause conflicts.)
  86                              <1> ;;
  87                              <1> ;;  As result of these conditions,
  88                              <1> ;;  all kernel pages must be initialized as equal to
  89                              <1> ;;  physical layout for preventing page faults.
  90                              <1> ;;  Also, calling "allocate page" procedure after
  91                              <1> ;;  a page fault can cause another page fault (double fault)
  92                              <1> ;;  if all kernel page tables would not be initialized.
  93                              <1> ;;
  94                              <1> ;;  [first_page] = Beginning of users space, as offset to
  95                              <1> ;;  memory allocation table. (double word aligned)
  96                              <1> ;;
  97                              <1> ;;  [next_page] = first/next free space to be searched
  98                              <1> ;;  as offset to memory allocation table. (dw aligned)
  99                              <1> ;;
 100                              <1> ;;  [last_page] = End of memory (users space), as offset
 101                              <1> ;;  to memory allocation table. (double word aligned)
 102                              <1> ;;
 103                              <1> ;; USER PAGE TABLES:
 104                              <1> ;;  Demand paging (& 'copy on write' allocation method) ...
 105                              <1> ;;          'ready only' marked copies of the
 106                              <1> ;;          parent process's page table entries (for
 107                              <1> ;;          same physical memory).
 108                              <1> ;;          (A page will be copied to a new page after
 109                              <1> ;;           if it causes R/W page fault.)
 110                              <1> ;;
 111                              <1> ;;  Every user process has own (different)
```

```
<1> ;;  page directory and page tables.
<1> ;;
<1> ;;  Code starts at virtual address 0, always.
<1> ;;  (Initial value of EIP is 0 in user mode.)
<1> ;;  (Programs can be written/developed as simple
<1> ;;   flat memory programs.)
<1> ;;
<1> ;; MEMORY ALLOCATION STRATEGY:
<1> ;;  Memory page will be allocated by kernel only
<1> ;;         (in kernel/system mode only).
<1> ;;  * After a
<1> ;;    - 'not present' page fault
<1> ;;    - 'writing attempt on read only page' page fault
<1> ;;  * For loading (opening, reading) a file or disk/drive
<1> ;;  * As responce to 'allocate additional memory blocks'
<1> ;;    request by running process.
<1> ;;  * While creating a process, allocating a new buffer,
<1> ;;    new page tables etc.
<1> ;;
<1> ;;  At first,
<1> ;;  - 'allocate page' procedure will be called;
<1> ;,     if it will return with a valid (>0) physical address
<1> ;;     (that means the relevant M.A.T. bit has been RESET)
<1> ;;     relevant memory page/block will be cleared (zeroed).
<1> ;;  - 'allocate page' will be called for allocating page
<1> ;;     directory, page table and running space (data/code).
<1> ;;  - every successful 'allocate page' call will decrease
<1> ;;    'free_pages' count (pointer).
<1> ;;  - 'out of (insufficient) memory error' will be returned
<1> ;;    if 'free_pages' points to a ZERO.
<1> ;;  - swapping out and swapping in (if it is not a new page)
<1> ;;    procedures will be called as responce to 'out of memory'
<1> ;;    error except errors caused by attribute conflicts.
<1> ;;   (swapper functions)
<1> ;;
<1> ;;  At second,
<1> ;;  - page directory entry will be updated then page table
<1> ;;    entry will be updated.
<1> ;;
<1> ;; MEMORY ALLOCATION TABLE FORMAT:
<1> ;;  - M.A.T. has a size according to available memory as
<1> ;;    follows:
<1> ;;            - 1 (allocation) bit per 1 page (4096 bytes)
<1> ;;            - a bit with value of 0 means allocated page
<1> ;;            - a bit with value of 1 means a free page
<1> ;,  - 'free_pages' pointer holds count of free pages
<1> ;;    depending on M.A.T.
<1> ;;         (NOTE: Free page count will not be checked
<1> ;;         again -on M.A.T.- after initialization.
<1> ;;         Kernel will trust on initial count.)
<1> ;,  - 'free_pages' count will be decreased by allocation
<1> ;;    and it will be increased by deallocation procedures.
<1> ;;
<1> ;;  - Available memory will be calculated during
<1> ;;    the kernel's initialization stage (in real mode).
<1> ;;    Memory allocation table and kernel page tables
<1> ;;    will be formatted/sized as result of available
<1> ;;    memory calculation before paging is enabled.
<1> ;;
<1> ;; For 4GB Available/Present Memory: (max. possible memory size)
<1> ;;  - Memory Allocation Table size will be 128 KB.
<1> ;;  - Memory allocation for kernel page directory size
<1> ;;    is always 4 KB. (in addition to total allocation size
<1> ;;    for page tables)
<1> ;;  - Memory allocation for kernel page tables (1024 tables)
<1> ;;    is 4 MB (1024*4*1024 bytes).
<1> ;;  - User (available) space will be started
<1> ;;    at 6th MB of the memory (after 1MB+4MB).
<1> ;;  - The first 640 KB is for kernel's itself plus
<1> ;;    memory allocation table and kernel's page directory
<1> ;;    (D0000h-EFFFFh may be used as kernel space...)
<1> ;;  - B0000h to B7FFFh address space (32 KB) will be used
<1> ;;    for buffers.
<1> ;;  - ROMBIOS, VIDEO BUFFER and VIDEO ROM space are reserved.
<1> ;,    (A0000h-AFFFFh, C0000h-CFFFFh, F0000h-FFFFFh)
<1> ;;  - Kernel page tables start at 100000h (2nd MB)
<1> ;;
<1> ;; For 1GB Available Memory:
<1> ;;  - Memory Allocation Table size will be 32 KB.
<1> ;;  - Memory allocation for kernel page directory size
<1> ;;    is always 4 KB. (in addition to total allocation size
<1> ;;    for page tables)
<1> ;;  - Memory allocation for kernel page tables (256 tables)
<1> ;;    is 1 MB (256*4*1024 bytes).
<1> ;;  - User (available) space will be started
<1> ;;    at 3th MB of the memory (after 1MB+1MB).
<1> ;;  - The first 640 KB is for kernel's itself plus
<1> ;;    memory allocation table and kernel's page directory
<1> ;;    (D0000h-EFFFFh may be used as kernel space...)
<1> ;;  - B0000h to B7FFFh address space (32 KB) will be used
<1> ;;    for buffers.
<1> ;;  - ROMBIOS, VIDEO BUFFER and VIDEO ROM space are reserved.
<1> ;,    (A0000h-AFFFFh, C0000h-CFFFFh, F0000h-FFFFFh)
<1> ;;  - Kernel page tables start at 100000h (2nd MB).
<1> ;;
<1> ;;
<1>
<1>
<1> ;;*************************************************************************************
<1> ;;
<1> ;; RETRO UNIX 386 v1 - Paging (Method for Copy On Write paging principle)
<1> ;; DEMAND PAGING - PARENT&CHILD PAGE TABLE DUPLICATION PRINCIPLES (23/04/2015)
<1>
<1> ;; Main factor: "sys fork" system call
<1> ;;
<1> ;;         FORK
<1> ;;                       |----> parent - duplicated PTEs, read only pages
<1> ;;  writable pages ---->|
<1> ;;                       |----> child - duplicated PTEs, read only pages
<1> ;;
<1> ;; AVL bit (0) of Page Table Entry is used as duplication sign
<1> ;;
<1> ;; AVL Bit 0 [PTE Bit 9] = 'Duplicated PTE belongs to child' sign/flag (if it is set)
<1> ;; Note: Dirty bit (PTE bit 6) may be used instead of AVL bit 0 (PTE bit 9)
<1> ;;       -while R/W bit is 0-.
<1> ;;
<1> ;; Duplicate page tables with writable pages (the 1st sys fork in the process):
<1> ;; # Parent's Page Table Entries are updated to point same pages as read only,
<1> ;;   as duplicated PTE bit  -AVL bit 0, PTE bit 9- are reset/clear.
<1> ;; # Then Parent's Page Table is copied to Child's Page Table.
<1> ;; # Child's Page Table Entries are updated as duplicated child bit
<1> ;;   -AVL bit 0, PTE bit 9- is set.
<1> ;;
<1> ;; Duplicate page tables with read only pages (several sys fork system calls):
```

```
                        <1> ;; # Parent's read only pages are copied to new child pages.
                        <1> ;;   Parent's PTE attributes are not changed.
                        <1> ;;   (Because, there is another parent-child fork before this fork! We must not
                        <1> ;;    destroy/mix previous fork result).
                        <1> ;; # Child's Page Table Entries (which are corresponding to Parent's
                        <1> ;;   read only pages) are set as writable (while duplicated PTE bit is clear).
                        <1> ;; # Parent's PTEs with writable page attribute are updated to point same pages
                        <1> ;;   as read only, (while) duplicated PTE bit is reset (clear).
                        <1> ;; # Parent's Page Table Entries (with writable page attribute) are duplicated
                        <1> ;;   as Child's Page Table Entries without copying actual page.
                        <1> ;; # Child 's Page Table Entries (which are corresponding to Parent's writable
                        <1> ;;   pages) are updated as duplicated PTE bit (AVL bit 0, PTE bit 9- is set.
                        <1> ;;
                        <1> ;; !? WHAT FOR (duplication after duplication):
                        <1> ;; In UNIX method for sys fork (a typical 'fork' application in /etc/init)
                        <1> ;; program/executable code continues from specified location as child process,
                        <1> ;; returns back previous code location as parent process, every child after
                        <1> ;; every sys fork uses last image of code and data just prior the fork.
                        <1> ;; Even if the parent code changes data, the child will not see the changed data
                        <1> ;; after the fork. In Retro UNIX 8086 v1, parent's process segment (32KB)
                        <1> ;; was copied to child's process segment (all of code and data) according to
                        <1> ;; original UNIX v1 which copies all of parent process code and data -core-
                        <1> ;; to child space -core- but swaps that core image -of child- on to disk.
                        <1> ;; If I (Erdogan Tan) would use a method of to copy parent's core
                        <1> ;; (complete running image of parent process) to the child process;
                        <1> ;; for big sizes, i would force Retro UNIX 386 v1 to spend many memory pages
                        <1> ;; and times only for a sys fork. (It would excessive reservation for sys fork,
                        <1> ;; because sys fork usually is prior to sys exec; sys exec always establishes
                        <1> ;; a new/fresh core -running space-, by clearing all code/data content).
                        <1> ;; 'Read Only' page flag ensures page fault handler is needed only for a few write
                        <1> ;; attempts between sys fork and sys exec, not more... (I say so by thinking
                        <1> ;; of "/etc/init" content, specially.) sys exec will clear page tables and
                        <1> ;; new/fresh pages will be used to load and run new executable/program.
                        <1> ;; That is what for i have preferred "copy on write", "duplication" method
                        <1> ;; for sharing same read only pages between parent and child processes.
                        <1> ;; That is a pitty i have to use new private flag (AVL bit 0, "duplicated PTE
                        <1> ;; belongs to child" sign) for cooperation on duplicated pages between a parent
                        <1> ;; and it's child processes; otherwise parent process would destroy data belongs
                        <1> ;; to its child or vice versa; or some pages would remain unclaimed
                        <1> ;; -deallocation problem-.
                        <1> ;; Note: to prevent conflicts, read only pages must not be swapped out...
                        <1> ;;
                        <1> ;; WHEN PARENT TRIES TO WRITE IT'S READ ONLY (DUPLICATED) PAGE:
                        <1> ;; # Page fault handler will do those:
                        <1> ;;   - 'Duplicated PTE' flag (PTE bit 9) is checked (on the failed PTE).
                        <1> ;;   - If it is reset/clear, there is a child uses same page.
                        <1> ;;   - Parent's read only page -previous page- is copied to a new writable page.
                        <1> ;;   - Parent's PTE is updated as writable page, as unique page (AVL=0)
                        <1> ;;   - (Page fault handler whill check this PTE later, if child process causes to
                        <1> ;;     page fault due to write attempt on read only page. Of course, the previous
                        <1> ;;     read only page will be converted to writable and unique page which belongs
                        <1> ;;     to child process.)
                        <1> ;; WHEN CHILD TRIES TO WRITE IT'S READ ONLY (DUPLICATED) PAGE:
                        <1> ;; # Page fault handler will do those:
                        <1> ;;   - 'Duplicated PTE' flag (PTE bit 9) is checked (on the failed PTE).
                        <1> ;;   - If it is set, there is a parent uses -or was using- same page.
                        <1> ;;   - Same PTE address within parent's page table is checked if it has same page
                        <1> ;;     address or not.
                        <1> ;;   - If parent's PTE has same address, child will continue with a new writable page.
                        <1> ;;     Parent's PTE will point to same (previous) page as writable, unique (AVL=0).
                        <1> ;;   - If parent's PTE has different address, child will continue with it's
                        <1> ;;     own/same page but read only flag (0) will be changed to writable flag (1) and
                        <1> ;;     'duplicated PTE (belongs to child)' flag/sign will be cleared/reset.
                        <1> ;;
                        <1> ;; NOTE: When a child process is terminated, read only flags of parent's page tables
                        <1> ;;       will be set as writable (and unique) in case of child process was using
                        <1> ;;       same pages with duplicated child PTE sign... Depending on sys fork and
                        <1> ;;       duplication method details, it is not possible multiple child processes
                        <1> ;;       were using same page with duplicated PTEs.
                        <1> ;;

1696                            <1> ;;  or it is a file, start address of the swap disk/volume is 0,
1697                            <1> ;;  and offset value is equal to absolute (physical or logical)
1698                            <1> ;;  address/position. (It has not to be ZERO if the swap partition
1699                            <1> ;;  is in a partitioned virtual hard disk.)
1700                            <1> ;;
1701                            <1> ;;  Note: Swap addresses are always specified/declared in sectors,
1702                            <1> ;;  not in bytes or       in blocks/zones/clusters (4096 bytes) as unit.
1703                            <1> ;;
1704                            <1> ;;  Swap disk/file allocation is mapped via 'Swap Allocation Table'
1705                            <1> ;;  at memory as similar to 'Memory Allocation Table'.
1706                            <1> ;;
1707                            <1> ;;  Every bit of Swap Allocation Table repsesents one swap block
1708                            <1> ;;  (equal to page size) respectively. Bit 0 of the S.A.T. byte 0
1709                            <1> ;;  is reserved for swap disk/file block 0 as descriptor block
1710                            <1> ;;  (also for compatibility with PTE). If bit value is ZERO,
1711                            <1> ;;  it means relevant (respective) block is in use, and,
1712                            <1> ;;  of course, if bit value is 1, it means relevant (respective)
1713                            <1> ;;      swap disk/file block is free.
1714                            <1> ;;  For example: bit 1 of the byte 128 repsesents block 1025
1715                            <1> ;;  (128*8+1) or sector (offset) 8200 on the swap disk or
1716                            <1> ;;  byte (offset/position) 4198400 in the swap file.
1717                            <1> ;;  4GB swap space is represented via 128KB Swap Allocation Table.
1718                            <1> ;;  Initial layout of Swap Allocation Table is as follows:
1719                            <1> ;;  ------------------------------------------------------------
1720                            <1> ;;  01111111111111111111111111 .... 11111111111111111111111111111111
1721                            <1> ;;  ------------------------------------------------------------
1722                            <1> ;;  (0 is reserved block, 1s represent free blocks respectively.)
1723                            <1> ;;  (Note: Allocation cell/unit of the table is bit, not byte)
```

```
1724                    <1> ;;
1725                    <1> ;;  ..........................................................
1726                    <1> ;;
1727                    <1> ;;  'swap_out' procedure checks 'free_swap_blocks' count at first,
1728                    <1> ;;  then it searches Swap Allocation Table if free count is not
1729                    <1> ;;  zero. From begining the [swpd_next] dword value, the first bit
1730                    <1> ;;  position with value of 1 on the table is converted to swap
1731                    <1> ;;  disk/file offset address, in sectors (not 4096 bytes block).
1732                    <1> ;;  'ldrv_write' procedure is called with ldrv (logical drive
1733                    <1> ;;  number of physical swap disk or virtual swap disk)
1734                    <1> ;;  number, sector offset (not absolute sector -LBA- number),
1735                    <1> ;;  and sector count (8, 512*8 = 4096) and buffer adress
1736                    <1> ;;  (memory page). That will be a direct disk write procedure.
1737                    <1> ;;  (for preventing late memory allocation, significant waiting).
1738                    <1> ;;  If disk write procedure returns with error or free count of
1739                    <1> ;;  swap blocks is ZERO, 'swap_out' procedure will return with
1740                    <1> ;;  'insufficient memory error' (cf=1).
1741                    <1> ;;
1742                    <1> ;;  (Note: Even if free swap disk/file blocks was not zero,
1743                    <1> ;;  any disk write error will not be fixed by 'swap_out' procedure,
1744                    <1> ;;  in other words, 'swap_out' will not check the table for other
1745                    <1> ;;  free blocks after a disk write error. It will return to
1746                    <1> ;;  the caller with error (CF=1) which means swapping is failed.
1747                    <1> ;;
1748                    <1> ;;  After writing the page on to swap disk/file address/sector,
1749                    <1> ;;  'swap_out' procesure returns with that swap (offset) sector
1750                    <1> ;;  address (cf=0).
1751                    <1> ;;
1752                    <1> ;;  ..........................................................
1753                    <1> ;;
1754                    <1> ;;  'swap_in' procedure loads addressed (relevant) swap disk or
1755                    <1> ;;  file sectors at specified memory page. Then page allocation
1756                    <1> ;;  procedure updates relevant page table entry with 'present'
1757                    <1> ;;  attribute. If swap disk or file reading fails there is nothing
1758                    <1> ;;  to do, except to terminate the process which is the owner of
1759                    <1> ;;  the swapped page.
1760                    <1> ;;
1761                    <1> ;;  'swap_in' procedure sets the relevant/respective bit value
1762                    <1> ;;  in the Swap Allocation Table (as free block). 'swap_in' also
1763                    <1> ;;  updates [swpd_first] pointer if it is required.
1764                    <1> ;;
1765                    <1> ;;  ..........................................................
